# **Data collection workshop**

### Introduction to the Arduino BLE Sense:

### **Download Arduino IDE & example code**

- https://www.arduino.cc/en/software
- 1. Install Arduino BLE Sense board
  - <a href="https://www.arduino.cc/en/Guide/NANO33BLESense">https://www.arduino.cc/en/Guide/NANO33BLESense</a>
- 2. Install Arduino BLE Sense examples
  - Matt's github: https://github.com/mattjarvis/data-collection-workshop-code
- 3. Upload blink sketch to test everything works ok!

## 1. Set up real-time serial connection to computer

- 1. Send real-time humidity & temperature data from sensors through the serial port:
  - Install the HTS221 library from the library manager
  - Open the HTS221 example from the example sketches menu
  - Upload the example sketch
  - Open the serial monitor and check you are getting data
- 2. Send the audio analysis through the serial port:
  - Open the PDM Serial Plotter example
  - Upload the PDM example sketch
  - Open the Serial Plotter
  - Make some noise!
  - Review the documentation: https://docs.arduino.cc/learn/built-in-libraries/pdm
  - What happens if you change the number of channels? How about the frequency?
- 3. Run a program on the computer to use the data in something
  - Change the channel number back to 1 in the PDM example sketch
  - Open the *GraphProcessingCode* Processing 3 sketch (Install Processing, if you don't have it: <a href="https://processing.org/download">https://processing.org/download</a>)
  - Change the number of the serial array index (line 29) to match your serial port (you can run the sketch and it will print the array)
  - · Run the sketch and watch the results
  - What happens if you change the input and output of the map() function (on line 63)?
- 4. Let's try getting some data in really fast, using the built in accelerometer
  - Open the Arduino sketch at <a href="https://github.com/mattjarvis/data-collection-workshop-code/blob/main/2%20-%20AccelerometerTest/AccelerometerTest.ino">https://github.com/mattjarvis/data-collection-workshop-code/blob/main/2%20-%20AccelerometerTest/AccelerometerTest.ino</a>
  - Upload it to the arduino
  - Open the Processing sketch from <a href="https://github.com/mattjarvis/data-collection-workshop-code/blob/main/ProcessingSketches/2%20-RotateCubeSerialInput/RotateCubeSerialInput.pde">https://github.com/mattjarvis/data-collection-workshop-code/blob/main/ProcessingSketches/2%20-RotateCubeSerialInput/RotateCubeSerialInput.pde</a>

**Extra challenge:** How would you add the sound from point 2, the PDM Serial Plotter example to point 4, the accelerometer example? (An answer is <u>here</u> and <u>here</u>)

# 2. Data logging

Now we are familiar in having the Arduino give us data, let's try and do something with it. Let's start by saving the data:

1. Upload the ENV sensing Arduino sketch

- https://github.com/mattjarvis/data-collection-workshop-code/tree/main/ 3.1 SendEnvData
- 2. Run a bridge program to save your data
  - <a href="https://github.com/mattjarvis/data-collection-workshop-code/tree/main/ProcessingSketches/sketch">https://github.com/mattjarvis/data-collection-workshop-code/tree/main/ProcessingSketches/sketch</a> 3 SaveSerialInputAsTable

# 3. Going online

Now let's look at ways to use the data with MQTT:

- 1. Upload the ENV sensing Arduino sketch
  - https://github.com/mattjarvis/data-collection-workshop-code/tree/main/ 3.1 SendEnvData
- 2. Run a bridge program to send data to MQTT on cci server
- https://github.com/mattjarvis/data-collection-workshop-code/tree/main/ ProcessingSketches/sketch\_4\_PublishSerialToMQTT
- 3. Show incoming MQTT data with <a href="http://mqtt-explorer.com/">http://mqtt-explorer.com/</a>
